I SEMESTER M.TECH. EC/BM END SEMESTER EXAMINATION MARCH 2021

Subject: PROBABILITY, RANDOM VARIABLES AND STOCHASTIC PROCESSES [MAT 5151]

Date of Exam: 05/03/2021 Time of Exam: 02.00 p. m. – 05.00 p.m. Max. Marks: 50

Answer ALL the questions.

A. A flashlight contains two batteries that sit one on top of the other. These batteries come from different batches and may be assumed to be independent of one another.Both batteries must work in order for the flashlight to work. If the probability that the first battery is defective is 0.05 and the probability that the second is defective is 0.15, what is the probability that the flashlight works properly? (3 marks)

B. In a room, there are two types of jars A and B containing candies. Jar A contains 40% of the candies and jar B contains the remaining 60%. In jar A, there are 70% sweet and 30% sour candies, whereas in jar B, there are 30% sweet and 70% sour candies. A candy is tasted and it is sweet. What is the probability that it is from jar A? (3 marks)

C. A problem in Mathematics is given to three students A, B and C whose chances of solving it are 0.5, 1/3 and 0.25. What is the probability that the problem will be solved? (4 marks)

2. A. The probability density function of a random variable is $f(x) = \begin{cases} x, 0 \le x < 1 \\ 2 - x, 1 \le x < 2 \\ 0, otherwise \end{cases}$ Find (i) the cumulative distribution function of X and (ii) $P[X \ge 1.5]$. (3 marks)

given by the folio	wing lable. Find L	(X), E(Y) and CO	variance(X,Y).	(5 marks)
X Y	X = 2	<i>X</i> = 3	X = 4	<i>X</i> = 5
Y = 0	0.05	0.05	0.15	0.05
Y = 1	0.40	0.00	0.00	0.00
Y = 2	0.05	0.15	0.10	0.00

B. Let X and Y be discrete random variables with joint probability mass function p(x, y) given by the following table. Find E(X), E(Y) and *Covariance*(X,Y). (3 marks)

C. Given the joint probability density function of X and Y as below, find the probability density function of X + Y. $f(x, y) = \begin{cases} \frac{1}{2}xe^{-y} \\ 0, elsewhere \end{cases}$, 0 < x < 2, y > 0 (4 marks)

3. A. Probability that a man hitting a target is 1/3. (i) If he fires five times, what is the probability that he hits the target at least twice? (ii) How many times must he fire so that the probability of hitting the target at least once is more than 0.90? (3 marks)

B. Heights of 500 soldiers are found to be normally distributed. Of these 258 are found to be within 2 cm of the mean height 170 cm. Find the standard deviation of the distribution. (3 marks)

C. A man tosses a fair coin until three heads occur in a row. Let X_n denote the largest string of heads ending at the n^{th} trial. Write the transition probability matrix for X_n and determine the nature of the states. (4 marks)

4. A. Suppose that the weather on any day depends on the weather conditions for the previous days, i.e., Suppose it was sunny today and yesterday, then it will be sunny tomorrow with probability 0.8; if it was sunny today but cloudy yesterday, then it will be sunny tomorrow with probability 0.6; if it was cloudy today but sunny yesterday, then it will be sunny tomorrow with probability 0.4; if it was cloudy for the last two days, then it will be sunny tomorrow with probability 0.1. Transform the process into a Markov chain and obtain the stationary probability distribution of the states. (5 marks)

B. An experiment was performed to determine the effect of four different chemicals on the strength of a fabric. These chemicals are used as part of the permanent press finishing process. Five fabric samples were selected, and the following design was run by testing each chemical type once in random order on each fabric sample. Test for differences in means at 1% level of significance. (5 marks)

Chemical		Fa	abric sample		
type	1	2	3	4	5
1	1.3	1.6	0.5	1.2	1.1
2	2.2	2.4	0.4	2.0	1.8
3	1.8	1.7	0.6	1.5	1.3
4	3.9	4.4	2.0	4.1	3.4

A. Defects on wafer surfaces in integrated circuit fabrication are unavoidable. In a particular process, the following data were collected. Does the assumption of a Poisson distribution seem appropriate as a probability model for this process? Test at 5% level of significance. (7 marks)

												(
No. of	0	1	2	3	4	5	6	7	8	9	10	11	12
defects													
No. of	4	13	34	56	70	70	58	42	25	15	9	3	1
defect													
wafers													

B. The process of drilling holes in printed circuit boards produces diameters with a standard deviation of 0.01 milli meter. How many diameters must be measured so that the probability is at least 8/9 that the average of the measured diameters is within 0.005 of the process mean diameter μ ? (3 marks)

Note: Please see pages below for statistical tables.
